

# WHO Epidemiological Brief

A monthly publication on vaccine-preventable diseases and immunization data and analysis

## Highlighting in the WHO European Region:

- Update on measles in the European Region
- Ukraine: Measles outbreak
- Status and source of regional measles and rubella data
- Establishment of European Regional Verification Commission for Measles and Rubella Elimination (RVC)
- Acute Flaccid Paralysis Surveillance: Performance Indicators

## Summary

### Update on measles and rubella

The Region continues to experience a significant number of both measles and rubella cases, with more than 34 000 confirmed measles cases and nearly 4 000 suspected rubella cases in 2011. A rubella outbreak in Romania and an ongoing measles outbreak in Ukraine are of particular note and concern.

### European Regional Verification Commission for Measles and Rubella Elimination (RVC)

The first meeting of the RVC took place in Copenhagen in January 2011. At this meeting, the RVC adopted a framework developed by the WHO Regional Office for Europe to document progress towards and verify the 2015 elimination goal.

### Acute Flaccid Paralysis Surveillance

In the European Region, many Member States conducting AFP surveillance are not achieving WHO targets for case detection and adequate stool specimen collection. To promptly detect poliovirus importation in a Member State, it is crucial that the targets for these two indicators are achieved.

## Update on measles and rubella in the European Region

### Measles in 2011

As of 1 February 2012, a total of 34 250 confirmed measles cases have been reported in the WHO European Region in 2011 by 42 Member States. The annual measles data, acquired through monthly reporting from Member States, should be completed

with the December report from each Member State.

### Measles in December 2011 (monthly report):

The total of 965 cases reported in December is within the range of monthly cases reported in November (970), but higher than measles morbidity data reported in October and September (618 and 729 cases respectively). The number of reported measles cases is high, and increasing in the last two months of 2011, in France (121 in November, 140 in December), Romania (388 in November, 544 in December) and the Russian Federation (207 in November, 176 in December).

Expected monthly measles surveillance reports for December have been received from 41 Member States; 17 countries reported 965 confirmed measles cases and 24 provided a "zero" report (no measles cases in December).

### Rubella in 2011

As of 01 February 2012, 3706 suspected rubella cases were reported in 2011 by 25 of 42 Member States. Of these cases, 76 were discarded and 3629 were confirmed. However, only 456 are laboratory confirmed rubella (reported by eighteen Member States).

### Rubella in December 2011 (monthly report):

The total of 1389 suspected (1375 of these confirmed) rubella cases were reported in December. Highest number of cases in November and December is reported from Romania (1529 cases in November and 1375 in December). A rubella outbreak in the Salaj region of north-west Romania was reported to WHO in December 2011; due to this outbreak, Romania experienced 3380 confirmed cases in 2011.

Reports for December were received from 33 of 42 Member States. Most countries provided a "zero" report (29 with no cases in December), and four countries reported 1389 suspected rubella cases (Armenia, Georgia, Ireland, Romania).

## Ukraine: Measles outbreak

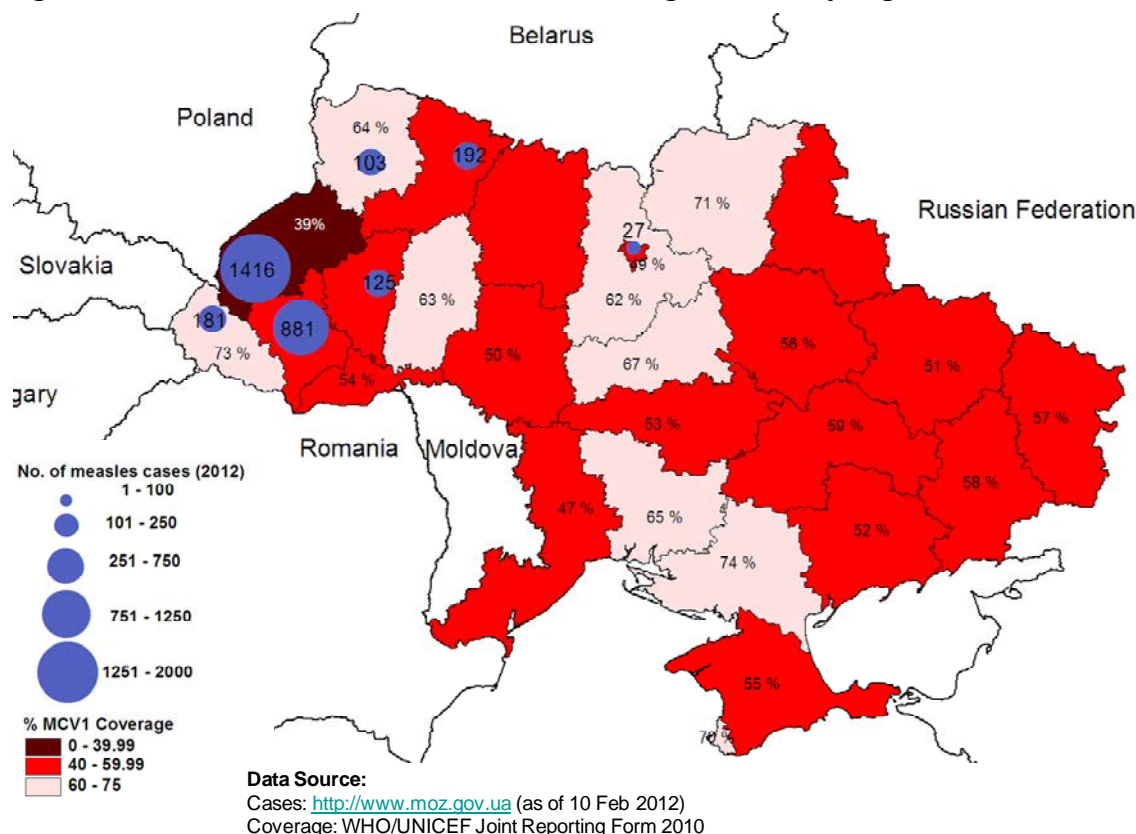

According to monthly reports, 194 cases of measles were diagnosed in Ukraine between January and October 2011. Ukraine has not submitted measles and rubella data to the WHO Regional Office for Europe for the last two months of 2011, when national health authorities informed WHO of an increase in measles morbidity in western regions of the country (most of them in Lviv and Ivano-Frankivsk regions), where outbreaks among high-school students were reported.

As of 10 February 2012, 3 162 suspected cases of measles were reported by the Ukrainian Ministry of Health on their web site since the beginning of the year. Over the course of January and the beginning of February 2012, it is clear that Ukraine is facing a large outbreak and that transmission is continuing. Most of the cases are located in western administrative regions, with the highest count in the Lviv region (1 416 cases in 2012, MCV1 coverage <40%) (See Figure 1). According to the WHO/UNICEF Joint Reporting Form (JRF) for 2010, official national coverage with first dose of measles-mumps-rubella combined vaccine (MMR1) was 56.1%, and coverage with second dose of measles-mumps-rubella combined vaccine (MMR2) was 40.7%. Similarly low cov-

erage was reported for other vaccines used in the immunization programme (DTP3 52%, HepB 48%, Polio 3 58%). Given the sub-optimal vaccination coverage rates at both national and sub-national levels in Ukraine, there is a threat that the current measles outbreak could match that of the large outbreak that occurred in 2006, with over 44 000 cases reported. Outbreaks of other vaccine preventable diseases are also highly possible, and this is of particular concern given that Ukraine has the largest cohort of unimmunized children in the Region.

The Ministry of Health announced that a special task force has been established and that a number of control measures have been put into place, including school closures and limiting visitors to hospitals. The Ministry of Health has requested that the WHO Regional Office for Europe provide technical assistance on how to localize and prevent the spread of measles cases in the country. WHO has emphasized that best practice for managing such outbreaks involves conducting a mass immunization campaign complemented by communications addressing the disease burden, vaccine safety and effectiveness. Experts from WHO headquarters and the Regional Office for Europe, ECDC, CDC and UNICEF visited Ukraine between 13-14 February to offer technical assistance.

**Figure 1. Measles cases in 2012 and MCV1 coverage in 2010 by Region, Ukraine.**

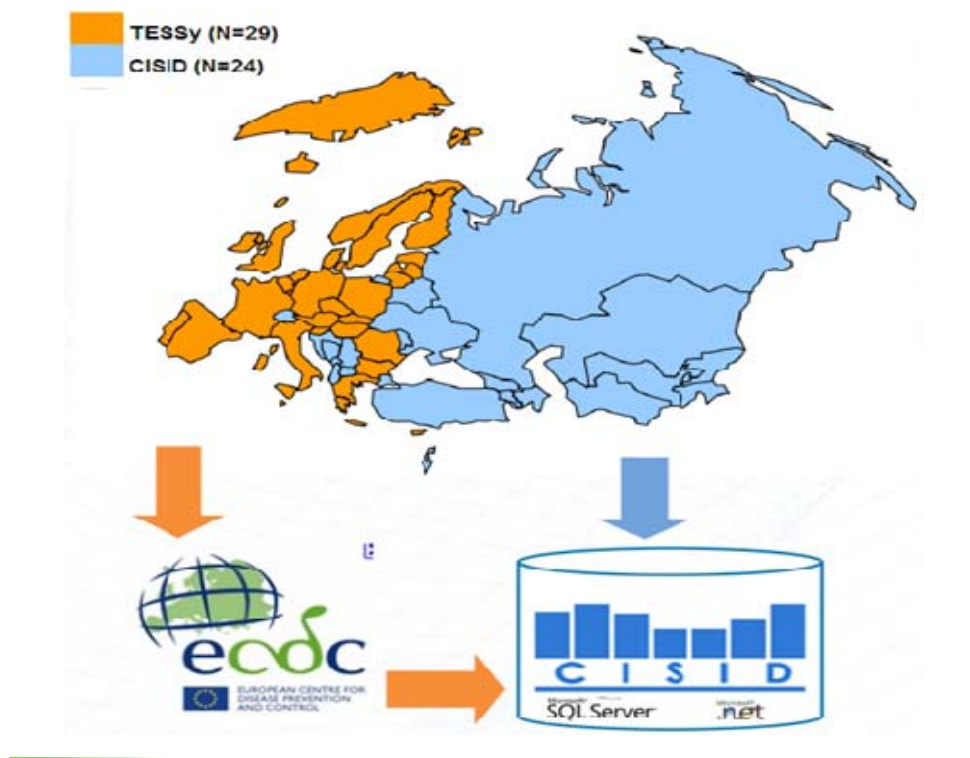

## Status and source of regional measles and rubella data

The WHO Regional Office for Europe relies on its Centralized Information System for Infectious Diseases (CISID), a regional data management tool, to receive, manage and disseminate communicable diseases data and information. All the data shared by the WHO Regional Office for Europe, including all data presented and analysed in this and all previous issues of Epidemiological Brief, are maintained in CISID and can be viewed and retrieved directly from the following link: <http://data.euro.who.int/cisid/>.

Of the 53 Member States in the WHO European Region, 24 directly report monthly measles and rubella data to CISID either by email or using online CISID data entry application. The remaining 29 Member States report to the TESSy database (managed by the European Centre for Disease Control (ECDC)). This data is then submitted, on a monthly basis, to CISID. The WHO Regional Office for Europe is grateful for this collaboration and encourages all Member States to report monthly data in a timely manner (within a period of 25 days after the end of the month) to CISID/TESSy.

**Fig 2. Member States of the WHO European Region by database to which they report, CISID/TESSy**

## European Regional Verification Commission for Measles and Rubella Elimination (RVC) established

Countries in the WHO European Region have committed to eliminating measles and rubella by 2015. WHO/Europe has developed a framework to document progress towards and verify elimination.

The European Regional Verification Commission for Measles and Rubella Elimination (RVC) met for the first time on 24–25 January 2012, in Copenhagen,

Denmark. Zsuzsanna Jakab, WHO Regional Director for Europe, welcomed RVC's eight members and thanked them for their commitment to the verification process.

The RVC will meet at least once a year to evaluate and verify progress towards elimination and, when necessary, visit countries to deal with specific issues. It will liaise with national commissions overseeing the verification process within countries. Advocating further action where necessary will be another key part of its work.

## Acute Flaccid Paralysis Surveillance: Performance Indicators

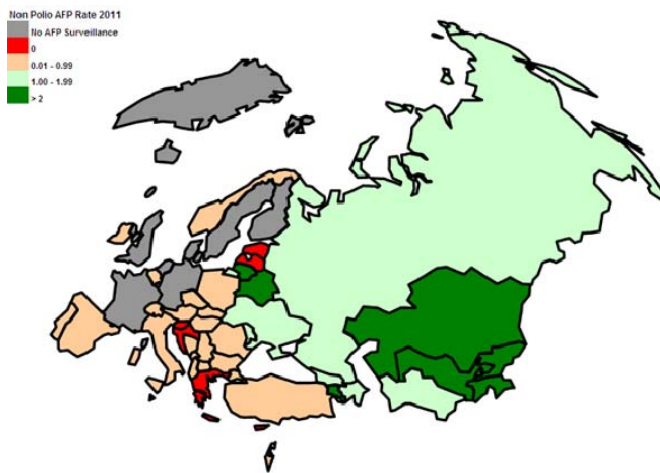

Surveillance of acute flaccid paralysis (AFP) has proven to be a reliable measure for demonstrating the absence of wild poliovirus transmission and continues to be a “golden standard” for poliovirus surveillance. In the WHO European Region, AFP surveillance performance is monitored using WHO targets for case detection and adequate stool specimen collection. In 2011, 42 of the 53 member states in the WHO European Region conducted AFP surveillance. The target of detecting and reporting at least one non-polio AFP (NPAFP) case per 100 000 children  $\leq$  14 years of age was achieved by only 13 (34%) of the 38 Member States that have not experienced polio cases in recent years (Figure 3a). Of the four Member States that experienced polio outbreaks in 2010, only two (Kazakhstan and Tajikistan) reported NPAFP

detection rates of at least two cases per 100 000 children  $\leq$  14 years of age. The adequate stool specimen collection target of  $\geq$ 80% was attained by only 21 (50%) countries (Figure 3b).

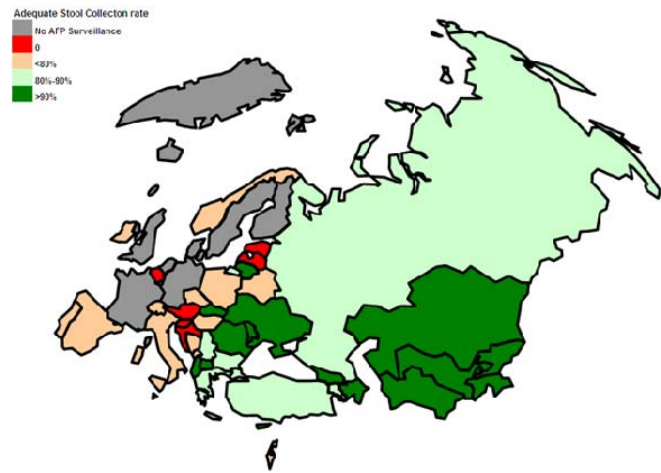

These two indicators are key to assessing the quality of AFP surveillance in the Member States and in identifying gaps in surveillance. To promptly detect poliovirus importation in a Member State, it is crucial that the targets for these two indicators are achieved.

The WHO European Region was certified polio-free in 2002. In 2010, four Member States in the Region experienced outbreaks of polio, after a wild poliovirus importation in Tajikistan. Effective measures were taken to interrupt the circulation of imported wild poliovirus within six months, and in August 2011 it was announced by the Regional Certification Commission that the WHO European Region had retained its polio-free status.

**Figure 3a. Non-polio AFP rate per 100 000 children  $\leq$  14 years of age, by Member State in the WHO European Region, in 2011**

**Figure 3b. Adequate stool collection target ( $\geq$ 80%) by Member State in the WHO European Region, in 2011.**

Monthly Summary Table 1. Classification of reported suspected measles cases, January—December 2011 (data as of 1 Feb 2012)

Country	Total Population <sup>1</sup>	Incidence Rate per 1 million population (Jan-Dec)	Total confirmed measles	Classification			Discarded	Importation <sup>3</sup>	Reporting			Surveillance Indicators <small>(Please click here to refer Annex 8 of MR Surveillance guideline)</small>

Data source: Monthly aggregate and case-based data reported by Member States to WHO/Europe and ECDC/TESSy

<sup>1</sup> Source: "World Population Prospects: The 2008 Revision", New York, United Nations and updates provided by Member States.

<sup>2</sup> Cases with missing classification are classified as "Clinical".

<sup>3</sup> Imported or import related rubella cases included in total rubella.

Indicators not meeting target and countries not reporting monthly rubella data are highlighted in red. "-" indicates data not available/applicable or can not be calculated due to insufficient denominator.

Monthly Summary Table 3: Confirmed measles cases for last 12 months, November 2010—December 2011 (data as of 1 Feb 2012)

<sup>1</sup> AFP case of all ages (Denmark, Finland, France, Iceland, Luxembourg, Monaco, Netherlands, San Marino, Sweden and United Kingdom do not report AFP cases. High quality surveillance (e.g. enterovirus and/or environmental) to detect poliovirus exists in Member States with no AFP surveillance.

<sup>2</sup> Hot cases = AFP case reported with a priority code (e.g. less than three doses of polio vaccine/Clinically polio/Recent travel to endemic country/high risk group).

<sup>3</sup> Non-polio AFP cases per 100 000 children under the age of 15 years (annualized for current year). Number of non-polio (discarded) AFP cases X 100000 / total population under 15 years.

<sup>4</sup> two stool samples collected with 14 days and 48 hours apart.

<sup>5</sup> Surveillance Index = non-polio AFP rate up to 1.0 x (% AFP cases with at least 1 adequate specimens within 14 days of onset).

\*Countries infected in 2010. Nonpolio AFP Rate and Surveillance Index targets for these member states have been revised to 2.0 and 1.6 respectively.
