

# Outbreaks of DISEASES

like measles show that some individuals and communities are still susceptible to vaccine-preventable diseases in the European Region.

There were over

60 000

cases of measles in 2011-2012;

23 000

cases were hospitalized.

Every year nearly

1 000 000

infants do not receive all scheduled vaccinations.

Why?

Vaccination depends on many different health system, social and behavioural factors.

The Guide to Tailoring Immunization Programmes (TIP) helps national immunization programmes to

**identify** susceptible populations

**diagnose** the supply – and demand-side barriers to vaccination

**design** evidence-informed responses

For more information on how to “TIP” the balance in favour of immunization, go to [www.euro.who.int/immunizationtip](http://www.euro.who.int/immunizationtip)
